Department of Intelligence Science and Technology

Construction and Elucidation of Intelligence Realization of Flexible, Human-like Information Processing.

In an advanced information-oriented society, we require information processing with flexible, human-like information capabilities. Information processing in human and animal organic systems has developed by means of structural and functional adaptation to the environment through a long process of evolution; there is no other high-level processing capacity quite like it. Intelligence Science and Technology is a multidisciplinary field that aims to clarify the mechanisms of biological—particularly, human-information processing for the development of higher-level information processing.

Welcome to the World of Intelligence Science and Technology.
Welcome to Department of Intelligence Science and Technology

Intelligence Science and Technology is an interdisciplinary research field in which we study sophisticated human information processing and develop new technologies on the basis of an understanding of human intelligence. By “intelligence,” we do not mean simply “artificial intelligence” but rather a wider scope embracing intelligent aspects of human, systems, and information technology. More specifically, our research and educational activities include (i) basic mechanisms of human beings, such as life, brain, cognition, and behavior, (ii) information media related to language, speech/auditory, and visual information, and (iii) a broad range of topics related to intelligence and informatics, such as interaction between human and intelligent systems, artificial intelligence and machine learning, and software and networks. One of our distinguishing features is integration of these topics under a unique discipline, “intelligence science and technology,” notwithstanding that these topics are also investigated in separate research fields such as neuroscience, psychology, engineering, and computer science. Faculty members and students coming from a wide variety of academic backgrounds devote themselves to cooperating in pursuit of this common goal. We hope that, in this unique academic environment, many young students will engage in this exciting research field, tackle the mysteries of complex human intelligence, and develop new ideas for addressing challenging issues regarding intelligent media and computation.

Our department welcomes outstanding students from various fields besides those of computer science and engineering. We provide interdisciplinary curricula and research projects. Join us, and enjoy an intellectually exciting experience!

KAMITANI Yukiyasu
Professor, Department of Intelligence Science and Technology
1993 B.A., Department of Arts and Sciences, University of Tokyo
2001 Ph.D., Computation and Neural Systems, California Institute of Technology
2008 Head of Department of Neuroinformatics, ATR Computational Neuroscience Laboratories
2015 Professor, Kyoto University

### Teaching Staff

**Professors**
- KAMITANI Yukiyasu
- KUMADA Takatsune
- NAKAHARA Hiroyuki (RIKEN, Adjunct)
- YAMAMOTO Akihiro
- KASHIMA Hisashi
- NISHIDA Toyoaki
- KUROHASHI Sadao
- KAWAHARA Tatsuya
- NISHINO Ko
- OKABE Yasuo
- MORI Shinsuke
- AKUTSU Tatsuya
- (M) : Academic Center for Computing and Media Studies

**Associate Professors**
- YAMADA Makoto
- NAKAZAWA Atsushi
- KAWAHARA Daisuke
- Fabien CROMIERES
- YOSHII Kazuyoshi
- IYAMA Masaaki (M)
- MIYAZAKI Shuichi (M)
- TAMURA Takeyuki (Institute for Chemical Research)
- SHIMAZAKI Hideaki
- FUNAKOSHI Kotaro

**Senior Lecturers**
- HOSSOKA Hiroshi
- MIUZURA Hiroaki
- NOBUHARA Shohi

**Assistant Professors**
- MAEGAWA Shingo
- MAJIMA Kei
- ICHINOSE Natsuhiro
- KOBAYASHI Yasuaki
- OHMOTO Yoshimasa
- MURAWAKI Yugo
- INOUE Koji
- KOTANI Daisuke (M)

- MORI Tomoyo (Institute for Chemical Research)
- SHIMONISHI Kei
Brain and Cognitive Sciences

We aim to investigate both the cognitive and the physiological mechanisms of advanced biological, especially human, information processing and to explore possible applications of such mechanisms. For this purpose, we plan to analyze the information processing mechanisms of the nervous system at the molecular, biochemical and physiological levels; to elucidate the underlying principles; and to develop new artificial information processing systems. Moreover, we will analyze the processes of human sensation, perception, learning, memory, thought and inference from both a cognitive perspective and a computational neuroscience perspective in order to examine the mechanisms of these types of information processing.

Neuroinformatics

Decoding neural codes

Brain signals can be seen as “codes” that encode our mental contents. We study methods for modeling brain functions and representations using information science and technology including machine learning and artificial neural networks. Our approach is based on data-driven predictive models that relate brain data and mind states via analysis of massive neural, behavioral, and multimedia data. Using these models, we aim to understand basic principles of neural information processing, and seek to develop real-life applications such as brain–machine interfaces that exploit decoded brain information.

[Professor: KAMITANI Yukiyasu, Senior Lecturer: HOSOKAWA Hiroshi, Assistant Professor: MAEGAWA Hiroshi, Assistant Professor: MAJIMA Kei]

Psychoinformatics

Toward understanding human cognition and applying it to human-machine interface

Human activities in daily life are supported by basic cognitive functions, such as perception, attention, memory and high-order executive control. We investigate the psychological and neuroscientific bases of these cognitive functions (especially focusing on attention and executive function), using psychological experiments, brain-imaging and computational techniques. We are interested in human behavior not only in well-controlled experimental settings in a laboratory, but also in real-world settings such as IT-equipment use and real car driving. We are also interested in cognitive functions in a wide range of populations, from healthy young adults to older or disabled individuals.

[Professor: KUMADA Takatsune, Assistant Professor: ICHINOSE Natsuhiro]

Cognitive communication

Towards a systematic understanding of the human brain

In order to obtain a systematic understanding of the human brain, we engage in both experimental and theoretical research and education on how higher human cognitive functions operate. Specifically, we conduct studies that entail both psychological experiments and functional brain imaging to investigate how higher-level functions -- such as verbal and nonverbal communication, multi-modal integration, and mnemonic function -- are carried out in the brain. We are also developing new methods for brain imaging techniques to help us understand the mechanisms of human brain functioning.

[Professor: NISHIDA Shin’ya, Senior Lecturer: MIZUHARA Hiroaki]
Our research focus is on advanced data analysis methods such as machine learning and data mining, and on their applications to important real-world problems in various fields including marketing, healthcare, and industrial systems. Our research interest also includes human-computer cooperative problem solving for hard problems computers alone cannot solve.

[Professor: KASHIMA Hisashi, Associate Professor: YAMADA Makoto]

We will formalize the intelligent information processing seen in human activities and conduct studies on the basic principles that underlie these processes, as well as realization methods. Specifically, this will involve education and research relating to artificial intelligence information processing such as inductive logic, knowledge discovery, hypothetical reasoning, and evolvable computers, using mathematical logic, inference procedures, machine learning theories and self-organization.

[Professor: YAMAMOTO Akihiro, Assistant Professor: KOBAYASHI Yasuaki]
Collective intelligence

Data Analysis That Matters

Our research focus is on advanced data analysis methods such as machine learning and data mining, and on their applications to important real-world problems in various fields including marketing, healthcare, and industrial systems. Our research interest also includes human-computer cooperative problem solving for hard problems computers alone cannot solve.

[Professor: KASHIMA Hisashi, Associate Professor: YAMADA Makoto]

Conversational Informatics

Design and understanding of social intelligence and interaction

People converse with each other for many reasons: to exchange information, to discuss an issue, to resolve a conflict, to increase mutual understanding, to compose a joint story, or just for fun. Conversation will remain as a vital means for people to communicate with other people and autonomous agents in the emerging human-agent symbiotic society. Our group centers on understanding and augmenting conversational interactions. We are keen to provoke and support empathic conversation in which participants are engaged in a game-like activity to make tacit thoughts explicit and organize them into a larger discourse in a very effective trial-and-error fashion. Building and management of common ground consisting of a shared knowledge and belief among participants is a key issue to make it happen. We take a data-intensive approach to acquire and utilize data entailing how participants interact with each other, what information to be shared, and which aspects of the environment are relevant. We aim at building a computational framework for sharing and cultivating wisdom through enhancing conversational interactions and facilitating conversational content in a community. The primary theoretical backbone is conversation quantization that characterizes conversation as a series of conversational quanta, each of which packages information about relevant participants, references to the objects and events discussed in the discourse, a series of verbal and nonverbal utterances exchanged by the participants, commitments to previous discourse (themes), and new propositions in the discourse (rhemes). We focus on smart conversation space, conversation capture, conversation production, cognitive approach, and synthetic evidential study.

[Professor: NISHIDA Toyoaki, Associate Professor: NAKAZAWA Atsushi, Assistant Professor: OHMOTO Yoshimasa]
Intelligent Media

The Intelligence Media Division deals with language, speech, and visual information, which are the fundamental media that represent, accumulate and communicate information. Research and education conducted at the Division cover a wide range of topics in theory and application, including analysis, recognition and understanding of information contents represented in these media, as well as media generation/editing to effectively represent and communicate information.

Language Media Processing

Making computers that can understand language

Language is the most reliable medium of human intellectual activities. Our objective is to establish the technology and academic discipline for handling and understanding language, in a manner that is as close as possible to that of humans, using computers. These include the following research areas.

—Fundamental Studies on Text Understanding—
By having a computer cluster process over 10 billion sentences collected from websites, we are conducting research on automatic learning of patterns of predicate-argument structures, inter-event relations, etc., as well as knowledge-based sentence comprehension; that is, analysis of relationships among words, phrases, and sentences in a passage.

—With the advance of research into application of language processing in the real world, such processing is beginning to be used in a variety of fields. Through cooperation with various institutions that possess real data, we are working on ways to apply language processing in a real world context.

Speech and Audio Processing

Recognition and understanding of speech, audio and music

Speech communication plays a key role in human intelligence. We are studying the intelligent processing of speech, audio and music as exchanged by human beings for automatic recognition, understanding and interaction systems, specifically (1) automatic speech transcription of meetings and lectures, (2) analysis of audio scenes and music signals composed of multiple sound sources, and (3) humanoid robots capable of natural interaction by combining non-verbal information.

[Professor: KAWAHARA Tatsuya, Associate Professor: YOSHII Kazuyoshi, Assistant Professor: INOUE Koji]
Neural substrates dedicated to vision is said to occupy about 40 percent of the cerebral cortex. Realizing computer vision as a truly intelligent perceptual modality is fundamental for artificial intelligence, and would also inform our understanding of human visual intelligence. Towards computational visual intelligence, our research is focused on establishing the theoretical foundations and efficient implementations of computational methods for better understanding people, objects and scenes from their appearance in images and video, as well as the development of novel computational imaging systems that can see beyond what we see.

[Professor: NISHINO Ko, Senior Lecturer: NOBUHARA Shohei]

Multimedia processing with computer devices has new and great potential for expression, information gathering and real-time dialogue processing. We aim to teach and study the technology of multimedia applications through the construction of educational environments in which we can make use of multimedia consisting of images, texts, sound, etc. In this way, students can engage in their studies while creating something of practical use in university courses.

Computers act as "information media" to support human activities and communication. Understanding human activities and recognizing the environments in which humans function are necessary for developing such information media.

We study intelligent information technologies for human-centric AI environments and apply them to various fields, such as education, tourism, culinary activities, and primary industries.

- Understanding student behavior for an adaptive education system.
- Smart kitchen system that understands and supports culinary activities.
- Tourist behavior and attribute recognition for recommending optimal activities in light of urban congestion.
- Global-scale environmental data processing for supporting people in primary industries.

[Associate Professor: IIYAMA Masaaki]
In a ubiquitous networking world, everything is capable of computing and networking, enabling constant Internet connectivity. Our research goal is to achieve just such an environment. To that end, we are working on fundamental research issues pertaining to the next-generation Internet, including IPv6 architecture and programmable networks, operation technologies such as automatic network configurations, platform technologies that support various services, such as identity federation, and security. We are also working on technologies for integration of information, communication through application of Internet protocols and algorithms such as routing, matching, reservation and interruption, and power management. We also work on design and analysis of algorithms for combinatorial optimization problems, and on proving the intractability of problems.

[Professor: OKABE Yasuo,  
Associate Professor: MIYAZAKI Shuichi,  
Assistant Professor: KOTANI Daisuke]

Demonstration of on-demand power network

Since time immemorial human knowledge has been recorded as text. The research activities of this group focus on computers capable of understanding these texts and describing new knowledge. As a basis we are studying fundamental natural language processing. And we are studying natural language generation to explain data analysis and future prediction by computer or to describe other media such as video and speech.

Specifically, we deal with real-world media, including procedural texts such as cooking recipes with execution videos, academic knowledge such as history/geography research, and game/data analysis by computers. We also try to expand human knowledge based on our research results.

[Professor: MORI Shinsuke,  
Assistant Professor: KAMEKO Hirotaka]

Network Media
Towards a ubiquitous networking world
Bio-system Informatics (Affiliated)

Biological systems and creatures are ineffably complex systems in which many kinds of chemical structures, proteins, genes and other objects interact with one another. We examine these as interactive networks to implement education and research aimed at elucidating and understanding the system, mainly from the perspective of information science.

Biological Information Networks

IT for analysis of biological information

We develop algorithms for inferring interactions among genes, proteins and chemical structures, and for analyzing their interactive networks based on mathematical methods. We also develop algorithms and software tools for other problems in bioinformatics, including sequence analysis and inference of higher-order structures and functions of protein.

[Professor: AKUTSU Tatsuya, Associate Professor: TAMURA Takeyuki, Assistant Professor: MORI Tomoya]

Cooperative Intelligence (Joint Research Chair)

In the near future, artificial intelligence will drastically change interpersonal relationships, or the involvement of humans in society. This joint research chair is aimed at establishing a new concept of “cooperative intelligence” toward a society in which humans and intellectual systems can coexist, and it investigates new technologies for realizing the concept. We are also seeking to develop a new form of open innovation under this joint research framework.

[Associate Professors: SHIMAZAKI Hideaki, FUNAKOSHI Kotaro, Assistant Professor: SHIMONISHI Kei]
